THE MT. DESERT NURSERIES
Bar Harbor, Maine

THE SITE OF THE MT. DESERT NURSERIES.

The land the Nurseries occupy is that of one of the few real farms that existed on Mt. Desert Island in old days, before the summer people came. It lies between the mountains and the Bay along the Schooner Head Road or Ocean Drive which passes through its midst. The office and green-houses lie on the roadside a mile to the southward of Bar Harbor, toward the sea. The Nursery land is good and has been well tilled and cultivated, but it is not rich, nor cultivating as many acres as we do, even intensively, is it commercially possible to enrich it greatly. So that the Nurseries' plants passing from it into the deep, rich soil of well made private gardens bring with them a hardy constitution and grow to greater size and bloom more freely than they do with us. The hardiness of the Nurseries' stock, however, is immensely increased by their northern situation and their land's exposure to the extremes of temperature and the rough storms and winds incidental to the eastern coast of Maine. Moreover this northern situation and the sea exposure, while they limit the range of plants which can be grown successfully, give to those which can be grown here an exceptional vigor which they carry with them when exported, and make it possible also for us to lift plants directly from the ground and make shipment of them at a time in the late Spring or early Summer when nurseries to the southward have long ceased to do so.

For Directions to Correspondents, and statement of the responsibilities assumed by us in the sale and shipment of stock, kindly consult our General Price List, which will be gladly mailed to any one writing to us for it. Address always

THE MOUNT DESERT NURSERIES,

WM. MILLER, Manager.

Bar Harbor, Me.

Phloxes, Peonies and Irises

PHLOXES, Peonies, and Japanese, German and Crimean Irises are among the plants to which we have given special attention and made a specialty of growing in their best and testing in their newest forms. We have now a very extensive collection of the finest obtainable in these, the result of years of careful selection, and we are still constantly testing and adding new varieties as they are introduced, discarding those which do not prove superior to existing ones and the old varieties when newer ones prove better in their kind.

Peonies, Irises, and many other early-flowering perennials do best if planted in the autumn, from August fifteenth to the end of October in our climate, or till later, correspondingly, further south. The earlier they are planted after the middle of August, however, the better, so that the plants may have time to get thoroughly rooted and established before severe weather sets in and checks their growth.

Phloxes and other late-flowering perennials should be planted later, from the first of September to the end of October in this region, or its correspondingly later season to the southward. As before, however, the earlier such planting can be done after the suitable season for it has come the better.

Peonies increase in size and beauty each year if left undisturbed and had best not be transplanted oftener than may be necessary, not thriving under frequent moving. They should be set out from two and one-half to three feet apart for permanent planting, annuals being used to fill in between them for the first two or three years until they get fully established and fill up the space themselves. Peonies are gross feeders, and annual applications of barn-yard manure should be given them as a mulch, or lightly spaded in around the plants. And, although they are perfectly hardy, it is best to give them for winter a light cover-

The Mount Desert Nurseries

ing of straw, strawy manure, or any similar litter that may be most convenient, to prevent alternate thawing and freezing, which is exceedingly injurious to most plants.

Phloxes, unlike Peonies, should be taken up every three or four years and either divided or planted further apart. Plants of ordinary size should be set out about one foot apart and larger plants further, according to their greater size. And before they are replanted the ground should be again trenched thoroughly and well manured. Phloxes should also be protected in the winter time in the same way as Peonies.

Japanese Irises should also be taken up every three or four years and divided, and the ground manured and trenched before they are re-planted, as for Phloxes, as the soil they are growing in becomes at length exhausted and the plants die out in the center; they should be set out, upon transplanting, about eighteen inches apart. In this latitude, and wherever the winters are severe, with much thawing and freezing, they do best if protected by a light covering of leaves two or three inches deep, which should be spread early, as soon as the ground begins to freeze hard, and removed gradually in the spring as soon as the danger from hard freezing is past.

The German Irises are hardier than the Japanese ones and do not really need protection, but nevertheless a winter covering such as recommended for Peonies and Phloxes will be beneficial to them also. As to replanting and dividing, the instructions for the Japanese Irises should be followed, setting them out upon transplanting about one foot apart.

When ordering from this Price List use the numbers only.
